

250MHz, Rail-to-Rail Output CMOS Operational Amplifier

1 FEATURES

- HIGH GAIN BANDWIDTH: 250MHz
- RAIL-TO-RAIL OUTPUT ±1.5mV TYP Vos
- INPUT VOLTAGE RANGE: -0.2V to +3.9V with Vs = 5V
- SUPPLY RANGE: +2.5V to +5.5V
- SPECIFIED UP TO +125°C
- Micro SIZE PACKAGES: SOT23-5

2 APPLICATIONS

- AUDIO ADC INPUT BUFFERS
- PHOTODIODE PREAMP
- HIGH-DENSITY SYSTEMS
- PORTABLE SYSTEMS
- DRIVING A/D CONVERTERS

3 DESCRIPTIONS

The RS875X families of voltage-feedback (VFB) products offer low voltage operation, negative-rail input, rail-to-rail output, as well as excellent speed/power consumption ratio, providing an excellent bandwidth (250MHz) and slew rate of 180V/us. The op-amps are unity gain stable and feature an ultra-low input bias current.

These amplifiers set an industry-leading power-toperformance ratio for rail-to-rail amplifiers. The RS875X families of operational amplifiers are specified at the full temperature range of -40°C to +125°C under single or dual power supplies of 2.5V to 5.5V.

7 SPECIFICATIONS

7.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted)⁽¹⁾

			MIN	MAX	UNIT
	Supply, V _S =(V+) - (V-)			7	
Voltage	Signal input pin ⁽²⁾		(V-)-0.5	(V+) +0.5	V
	Signal output pin ⁽³⁾		(V-)-0.5	(V+) +0.5	
	Signal input pin ⁽²⁾		-10	10	mA
Current	Signal output pin ⁽³⁾		-150	150	mA
	Output short-circuit ⁽⁴⁾		Continuous		
		SOT23-5		230	
		SOP8		110	
0		MSOP8		170	00 000
ALθ	Package thermal impedance ⁽⁵⁾	SOP14		105	°C/W
		TSSOP14		90	
		TSSOP8		240	
	Operating range, T _A		-40	125	
Temperature	Junction, T ^{J (6)}		-40	150	°C
	Storage, T _{stg}		-65	150	

(1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not implied.

(2) Input terminals are diode-clamped to the power-supply rails. Input signals that can swing more than 0.5V beyond the supply rails should be current-limited to 10mA or less.

(3) Output terminals are diode-clamped to the power-supply rails. Output signals that can swing more than 0.5V beyond the supply rails should be current-limited to ±150mA or less.

(4) Short-circuit to ground, one amplifier per package.

- (5) The package thermal impedance is calculated in accordance with JESD-51.
- (6) The maximum power dissipation is a function of $T_{J(MAX)}$, $R_{\theta JA}$, and T_A . The maximum allowable power dissipation at any ambient temperature is $P_D = (T_{J(MAX)} T_A) / R_{\theta JA}$. All numbers apply for packages soldered directly onto a PCB.

7.2 ESD Ratings

The following ESD information is provided for handling of ESD-sensitive devices in an ESD protected area only.

			VALUE	UNIT
Maria	Electrostatio discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±5000	V
V(ESD)	Electrostatic discharge	Machine Model (MM)	±400	v

(1) JEDEC document JEP155 states that 500 V HBM allows safe manufacturing with a standard ESD control process.

ESD SENSITIVITY CAUTION

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

7.3 Recommended Operating Conditions

Over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
Supply voltage M_{22} ((1) ((1)	Single-supply	2.5		5.5	V
Supply voltage, V _S = (V+) - (V-)	Dual-supply	±1.25		±2.75	v

7.4 ELECTRICAL CHARACTERISTICS

(At $T_A = +25^{\circ}$ C, $V_S = 5$ V, G = +2, $R_F = 1$ K Ω , and $R_L = 1$ K Ω connected to $V_S/2$, $V_{IN_CM} = V_S/2$, Full ⁽⁹⁾ = -40°C to +125°C, unless otherwise noted.)⁽¹⁾

en	Input Voltage Noise Density	f = 1 MHz		8	1	nV/√H	

NOTE:

(1) Electrical table values apply only for factory testing conditions at the temperature indicated. Factory testing conditions result in very limited self-heating of the device.

(2) Limits are 100% production tested at 25°C. Limits over the operating temperature range are ensured through correlations using statistical quality control (SQC) method.

(3) Typical values represent the most likely parametric norm as determined at the time of characterization. Actual typical values may vary over time and will also depend on the application and configuration.

(4) This parameter is ensured by design and/or characterization and is not tested in production.

(5) Positive current corresponds to current flowing into the device.

(6) The maximum power dissipation is a function of $T_{J(MAX)}$, $R_{\theta JA}$, and T_A . The maximum allowable power dissipation at any ambient temperature is PD = ($T_{J(MAX)} - T_A$) / $R_{\theta JA}$. All numbers apply for packages soldered directly onto a PCB.

(7) Short circuit test is a momentary test.

(8) Number specified is the slower of positive and negative slew rates.

(9) Specified by characterization only.

7.5 TYPICAL CHARACTERISTICS

NOTE: The graphs and tables provided following this note are a statistical summary based on a limited number of samples and are provided for informational purposes only.

At $T_A = +25^{\circ}$ C, $V_S = 5$ V, G = +2, $R_F = 1$ K Ω , and $R_L = 1$ K Ω connected to $V_S/2$, $V_{IN_CM} = V_S/2$, unless otherwise noted.

8 Detailed Description

8.1 Overview

The RS875X devices are unity-gain stable, dual and qual-channel op amps with low noise and distortion. The device consists of a low noise input stage with a folded cascade and a rail-to-rail output stage. This topology exhibits superior noise and distortion performance across a wide range of supply voltages that are not delivered by legacy commodity audio operational amplifiers.

8.2 Phase Reversal Protection

The RS875X family has internal phase-reversal protection. Many op amps exhibit phase reversal when the input is driven beyond the linear common-mode range. This condition is most often encountered in noninverting circuits when the input is driven beyond the specified common-mode voltage range, causing the output to reverse into the opposite rail. The input of the RS875X prevents phase reversal with excessive common-mode voltage. Instead, the appropriate rail limits the output voltage. This performance is shown in figure 15.

Figure 15. Output Waveform Devoid of Phase Reversal during an Input Overdrive Condition

8.3 EMI Rejection Ratio (EMIRR)

The electromagnetic interference (EMI) rejection ratio, or EMIRR, describes the EMI immunity of operational amplifiers. An adverse effect that is common to many operational amplifiers is a change in the offset voltage as a result of RF signal rectification. An operational amplifier that is more efficient at rejecting this change in offset as a result of EMI has a higher EMIRR and is quantified by a decibel value. Measuring EMIRR can be performed in many ways, but this document provides the EMIRR IN+, which specifically describes the EMIRR performance when the RF signal is applied to the noninverting input pin of the operational amplifier. In general, only the noninverting input is tested for EMIRR for the following three reasons:

• Operational amplifier input pins are known to be the most sensitive to EMI, and typically rectify RF signals better than the supply or output pins.

• The noninverting and inverting operational amplifier inputs have symmetrical physical layouts and exhibit nearly matching EMIRR performance.

• EMIRR is easier to measure on noninverting pins than on other pins because the noninverting input pin can be isolated on a printed-circuit-board (PCB). This isolation allows the RF signal to be applied directly to the noninverting input pin with no complex interactions from other components or connecting PCB traces.

Detailed Description (continued)

The EMIRR IN+ of the RS875X is plotted versus frequency in Figure 16. If available, any dual and quad operational amplifier device versions have approximately identical EMIRR IN+ performance. The RS875X unity-gain bandwidth is 250MHz. EMIRR performance below this frequency denotes interfering signals that fall within the operational amplifier bandwidth.

Figure 16.RS875X EMIRR vs Frequency

8.4 EMIRR IN+ Test Configuration

Figure 17 shows the circuit configuration for testing the EMIRR IN+. An RF source is connected to the operational amplifier noninverting input pin using a transmission line. The operational amplifier is configured in a unity-gain buffer topology with the output connected to a low-pass filter (LPF) and a digital multimeter (DMM). A large impedance mismatch at the operational amplifier input causes a voltage reflection; however, this effect is characterized and accounted for when determining the EMIRR IN+. The resulting dc offset voltage is sampled and measured by the multimeter. The LPF isolates the multimeter from residual RF signals that can interfere with multimeter accuracy.

Figure 17. EMIRR IN+ Test Configuration Schematic

9 Application and Implementation

Information in the following applications sections is not part of the RUNIC component specification, and RUNIC does not warrant its accuracy or completeness. RUNIC's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 APPLICATION NOTE

The RS8751, RS8752, RS8754 are high precision, rail-to-rail operational amplifiers that can be run from a singlesupply voltage 2.5V to 5.5V (±1.25V to ±2.75V). Supply voltages higher than 7V (absolute maximum) can permanently damage the amplifier. Rail-to-rail output swing significantly increases dynamic range, especially in low-supply applications. Good layout practice mandates use of a 0.1uF capacitor place closely across the supply pins.

9.2 Active Filters

The RS875X family can be used to design active filters. Figure 18 and Figure 19 show MFB and Sallen-key circuits designed using FilterProTM to implement 2nd order low-pass Butterworth filter circuits. Figure 20 shows the frequency response.

Figure 18. MFB 100 kHz 2nd Order Low-Pass Butterworth Filter Circuit

Figure 19. Sallen-Key 100 kHz 2nd Order Low-Pass Butterworth Filter Circuit

Figure 20. MFB and Sallen-Key 2nd Order Low-Pass Butterworth Filter Response

MFB and Sallen-Key filter circuits offer similar performance. The main difference is the MFB is an inverting amplifier in the pass band and the Sallen-Key is non-inverting. The primary pro for each is the Sallen-Key in unity gain has no resistor gain error term, and thus no sensitivity to gain error, while the MFB has inherently better attenuation properties beyond the bandwidth of the op amp.

10 LAYOUT

10.1 Layout Guidelines

Attention to good layout practices is always recommended. Keep traces short. When possible, use a PCB ground plane with surface-mount components placed as close to the device pins as possible. Place a 0.1uF capacitor closely across the supply pins.

These guidelines should be applied throughout the analog circuit to improve performance and provide benefits such as reducing the EMI susceptibility.

10.2 Layout Example

Figure 21. Schematic Representation

Figure 22. Layout Example

NOTE: Layout Recommendations have been shown for dual op-amp only, follow similar precautions for Single and four.
