

Octal Buffers and Line Drivers With 3-State Outputs

1 FEATURES

- **Power-Supply Range: 1.65V to 5.5V**
- **3-State Outputs Drive Bus Lines**
- **Low Power Consumption: 5 μ A I_{cc}(Max)**
- **\pm 24mA Output Drive at 3V**
- **Low Input Current of 1 μ A Max**
- **Extended Temperature: -40°C to 125°C**
- **Micro Size Packages: TSSOP20, SOP20**

2 APPLICATIONS

- **Servers**
- **Smart Grids**
- **Network Switches**
- **Infotainment**
- **Surveillance Cameras**

3 DESCRIPTIONS

The RS240 devices are organized as two 4-bit buffers/drivers with separate output-enable (\overline{OE}) inputs. When \overline{OE} is low, the device passes inverted data from the A inputs to the Y outputs. When \overline{OE} is high, the outputs are in the high-impedance state. V_{CC} supporting operating voltage from 1.65V to 5.5V.

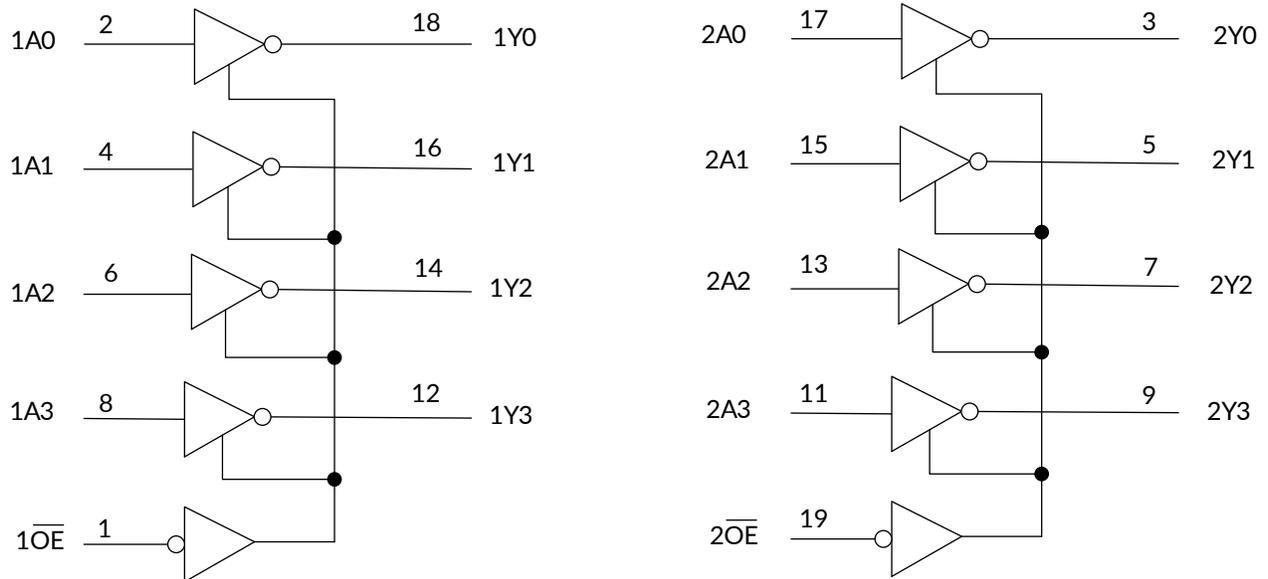

To ensure the high-impedance state during power up or power down, \overline{OE} should be tied to V_{CC} through a pullup resistor, the minimum value of the resistor is determined by the current-sinking capability of the driver.

Device Information ⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
RS240	TSSOP20	6.50mm \times 4.40mm
	SOP20	12.80mm \times 7.50mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

8 SPECIFICATIONS

8.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

SYMBOL	PARAMETER		MIN	MAX	UNIT
V _{CC}	Supply Voltage Range		-0.5	6.5	V
V _I ⁽²⁾	Input Voltage Range		-0.5	6.5	V
V _O ⁽²⁾⁽³⁾	Output Voltage Range		-0.5	V _{CC} +0.5	V
I _{IK}	Input clamp current	V _I <0		-50	mA
I _{OK}	Output clamp current	V _O <0		-50	mA
I _O	Continuous output current			±50	mA
	Continuous current through V _{CC} or GND			±100	mA
θ _{JA}	Package thermal impedance ⁽⁴⁾	TSSOP20		40	°C/W
		SOP20		40	
T _J	Junction Temperature ⁽⁵⁾		-40	150	°C
T _{stg}	Storage temperature		-65	150	

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) The input and output negative-voltage ratings may be exceeded if the input and output current ratings are observed.

(3) The value of V_{CC} are provided in the recommended operating conditions table.

(4) The package thermal impedance is calculated in accordance with JESD-51.

(5) The maximum power dissipation is a function of T_{J(MAX)}, R_{θJA}, and T_A. The maximum allowable power dissipation at any ambient temperature is P_D = (T_{J(MAX)} - T_A) / R_{θJA}. All numbers apply for packages soldered directly onto a PCB.

8.2 ESD Ratings

The following ESD information is provided for handling of ESD-sensitive devices in an ESD protected area only.

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-Body Model (HBM), MIL-STD-883K METHOD 3015.9	±2000	V
		Charged-Device Model (CDM), ANSI/ESDA/JEDEC JS-002-2018	±1000	V
		Machine Model (MM), JESD22-A115C (2010)	±200	V

ESD SENSITIVITY CAUTION

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

8.3 Recommended Operating Conditions

V_{CC} is the supply voltage associated with the input port and output port. ⁽¹⁾⁽²⁾

PARAMETER		V_{CC}	MIN	TYP	MAX	UNIT
Supply voltage	V_{CC}		1.65		5.5	V
High-level input Voltage (V_{IH})	Inputs ⁽³⁾	1.65V to 1.95V	$V_{CC} \times 0.65$			V
		2.3V to 2.7V	1.7			
		3V to 3.6V	2			
		4.5V to 5.5V	$V_{CC} \times 0.7$			
Low-level input Voltage (V_{IL})	Inputs ⁽³⁾	1.65V to 1.95V			$V_{CC} \times 0.35$	V
		2.3V to 2.7V			0.7	
		3V to 3.6V			0.8	
		4.5V to 5.5V			$V_{CC} \times 0.3$	
Input voltage (V_i)	Input voltage		0		5.5	V
Output voltage (V_o)	Output voltage		0		V_{CC}	V
High-level output current (I_{OH})		1.65V to 1.95V			-4	mA
		2.3V to 2.7V			-8	
		3V to 3.6V			-24	
		4.5V to 5.5V			-32	
Low-level output current (I_{OL})		1.65V to 1.95V			4	mA
		2.3V to 2.7V			8	
		3V to 3.6V			24	
		4.5V to 5.5V			32	
Input transition rise or fall rate ($\Delta t / \Delta v$)	Data inputs	1.65V to 1.95V			20	ns/V
		2.3V to 2.7V			20	
		3V to 3.6V			10	
		4.5V to 5.5V			5	
T_A Operating free-air temperature			-40		125	$^{\circ}C$

(1) All unused or driven (floating) data inputs (I/Os) of the device must be held at logic HIGH or LOW (preferably V_{CC} or GND) to ensure proper device operation and minimize power.

(2) All unused control inputs must be held at V_{CC} or GND to ensure proper device operation and minimize power consumption.

(3) For V_{CC} values not specified in the data sheet, $V_{IH} \text{ min} = V_{CC} \times 0.7 \text{ V}$, $V_{IL} \text{ max} = V_{CC} \times 0.3 \text{ V}$.

8.4 Electrical Characteristics

over recommended operating free-air temperature range (TYP values are at $T_A = +25^\circ\text{C}$, Full = -40°C to 125°C , unless otherwise noted).

$5V \pm 0.5V$	2.7V	1.5V	15pF	2k Ω	0.3V

NOTES: A. C_L includes probe and jig capacitance.

B. Waveform 1 is for an output with internal conditions such that the output is low, except when disabled by the output control.

Waveform 2 is for an output with internal conditions such that the output is high, except when disabled by the output control.

C. All input pulses are supplied by generators having the following characteristics: $PRR \leq 10$ MHz, $Z_O = 50\Omega$, $dv/dt \geq 1V/ns$.

D. The outputs are measured one at a time, with one transition per measurement.

E. t_{PLZ} and t_{PHZ} are the same as t_{dis} .

F. t_{PZL} and t_{PZH} are the same as t_{en} .

G. t_{PLH} and t_{PHL} are the same as t_{pd} .

H. All parameters and waveforms are not applicable to all devices.

Figure 3. Load Circuit and Voltage Waveforms

10 Detailed Description

10.1 Overview

The RS240 devices are organized as two 4-bit buffers/drivers with separate output-enable (\overline{OE}) inputs. When \overline{OE} is low, the device passes inverted data from the A inputs to the Y outputs. When \overline{OE} is high, the outputs are in the high-impedance state. V_{CC} supporting operating voltage from 1.65V to 5.5V.

To ensure the high-impedance state during power up or power down, \overline{OE} should be tied to V_{CC} through a pullup resistor, the minimum value of the resistor is determined by the current-sinking capability of the driver.

11 Power Supply Recommendations

The power supply can be any voltage between the minimum and maximum supply voltage rating located in the Recommended Operating Conditions. Each V_{CC} terminal should have a good bypass capacitor to prevent power disturbance. A 0.1 μ F capacitor is recommended for this device. It is acceptable to parallel multiple bypass capacitors to reject different frequencies of noise. The 0.1 μ F and 1 μ F capacitors are commonly used in parallel. The bypass capacitor should be installed as close to the power terminal as possible for best results.

12 Layout

12.1 Layout Guidelines

When using multiple bit logic devices inputs should not ever float. In many cases, functions or parts of functions of digital logic devices are unused; for example, when only two inputs of a triple-input AND gate are used or only 3 of the 4 buffer gates are used. Such input pins should not be left unconnected because the undefined voltages at the outside connections result in undefined operational states. Specified below are the rules that must be observed under all circumstances. All unused inputs of digital logic devices must be connected to a high or low bias to prevent them from floating. The logic level that should be applied to any particular unused input depends on the function of the device. Generally, they will be tied to GND or V_{CC} whichever make more sense or is more convenient.
